

Human + AI Workflow Examples

Being a **builder and creator** means you're the one designing the workflows, shaping the solutions, and driving impact with AI as your engine.

This document captures AI workflow examples drawn from interviews with Salesforce subject matter experts, conducted as part of the Human + AI Design Lab pilot program. These workflows are examples of how some Salesforce teams are currently using AI tools in their everyday work, or are ideas for new workflows. This document is not meant to be a comprehensive list but representative examples of workflows.

These workflows are organized into four categories based on employees' roles:

Seller	Customer-facing sales and pre-sales professionals
Individual Contributor	Non-managerial employees across all functions
Engineer	Technical builders, developers, and UX
Leader	People managers and organizational decision-makers

How to Use These Workflows

Use these workflows as starting points and examples to help you develop your own workflow.

- Start with one workflow that maps to a real challenge you're facing right now.
- Document your prompts and results as you experiment — save them to a personal Slack Canvas.
- Share with your team to get feedback, and save to a Canvas for re-use.
- Always apply human judgment before any customer-facing or decision-critical output.
- Revisit your workflows quarterly as tools and capabilities evolve quickly.

Workflow Development

Identifying Tasks for AI Delegation: The Three Buckets Framework

Tools: Google Gemini, Slackbot, Notebook LM, or Cursor

Try this method when considering effective ways for Human + AI collaboration.

1. List the recurring tasks that make up your typical week.
2. For each task, categorize it into one of three buckets: (1) AI can do this alone, (2) this requires human judgment and should stay human-driven, or (3) this works best as a human + AI collaboration.
3. For tasks in bucket 1 or 3, draft an initial prompt and test it using your preferred AI tool: Gemini, Slackbot, Notebook LM, or Cursor.
4. Evaluate the output: does it save time, improve quality, or reduce cognitive load? If yes, add it to your workflow. If not, refine the prompt or move the task back to bucket 2.
5. Revisit your task list quarterly. As AI tools evolve, tasks that belong in bucket 2 today may move to bucket 3 in the future.

AI Workflow Self-Review: Stress-Testing Your Own Workflow

Tools: Google Gemini, Slackbot

This workflow review was designed to help stress-test the lab activity in the Human + AI Design Lab. Sometimes employees build workflows and deploy them immediately, skipping the step of asking what could go wrong. Using AI to help identify risks in a workflow is a fast way to pressure-test a workflow before relying on it. This example is using a pre-mortem prompt.

1. Complete a draft of your AI-assisted workflow by documenting the steps, prompts used, and outputs at each stage.
2. Paste the completed workflow into Gemini or Slackbot and prompt it to review the workflow for clarity, gaps, and potential failure points.
3. Ask a follow-up prompt (referred to as a pre-mortem): Assume this workflow fails six months from now. What went wrong? Review the AI-generated failure scenarios for relevance.
4. Identify the one or two risks most likely to materialize in your specific context and add mitigation steps to your workflow.
5. Share the revised workflow with a peer for a human devil's advocate review as they may catch risks the AI missed.

Agentforce Workflows

Using Agentforce: Querying Pre-Built Agents	
Tools: Agentforce (via Slack), Slackbot	
Business Problem: Employees may not be aware of the number of pre-built agents already available to them, and ways to improve the agent's output. As of May, 2026, there are 48 agents available in Slack that cover sales, support, enablement, and HR functions.	
1.	Open Slack and navigate to Tools > Agents to see the list of Agentforce agents available to you based on your role.
2.	Identify the agent most relevant to your task. For example, a sales agent for account preparation, a support agent for case triage, or an enablement agent for training resources.
3.	Prompt the agent with a specific, well-scoped question. Include relevant context: system names, the situation, and what you need.
4.	Review the agent's response. For knowledge retrieval tasks, the agent will pull from pre-configured internal sources, but be sure to validate important outputs before acting on them.
5.	If the agent cannot complete your request, escalate to Slackbot for broader Slack-based search, or route to the technical team for agent capability requests.

Workflows for Sellers

These workflows reflect how sellers and pre-sales professionals use AI tools to research accounts, prepare for meetings, and manage a large portfolio of customers.

Daily Organizational Awareness via Slack AI

Tools: Slackbot (Slack AI Daily Recap)

Business Problem: Keeping up with the pace of product and messaging change is one of the top challenges for all Salesforce employees. Slackbot's Daily Recap cuts monitoring time by approximately 80%, while still allowing sellers to drill into source content when needed. Human verification of summaries remains necessary since Slackbot does not yet have access across all Salesforce content.

1. Identify the Slack channels most relevant to your role — product updates, messaging changes, enablement announcements, and key initiative channels.
2. Mark each priority channel as part of your Slack AI Daily Recap using the channel settings.
3. Each morning, open your Daily Recap and review the AI-summarized updates across all marked channels.
4. For updates that need more detail, follow the reference links Slackbot provides to drill into the original source content.
5. Periodically review and update your channel list as your role evolves or priorities shift.

New Customer Account Onboarding Research

Tools: Slackbot, Salesforce CRM (Org62), Google Gemini, Notebook LM

Business Problem: Onboarding to support a new account can be time consuming and challenging to capture the relevant information. A 15-minute AI-generated podcast per account can replace what would traditionally take weeks of manual research.

1. Prompt Slackbot: 'Tell me everything I need to know about [account] as the AE aligned to this account this year.' Review the output and manually filter for the most relevant content.
2. Open the account record in Salesforce (Org62) and review contract purchase history, utilization data, and renewal patterns to build a historical engagement timeline.
3. Run a deep research query in Gemini to generate an external view: market positioning, industry outlook, and competitive landscape. Manually validate key facts before use.
4. Collect all available call transcripts, client presentations, and internal team decks related to the account from prior engagements.
5. Upload all compiled materials into Notebook LM to create a unified customer intelligence repository.
6. Use Notebook LM to generate a custom AI podcast briefing: prompt it to focus on the customer's key priorities, business challenges, industry competitors, and relevant Salesforce solution opportunities.
7. Listen to the generated podcast to absorb account context — then use the same repository to generate a slide deck, mind map, or flashcards as needed.

New Customer Account Onboarding Research V. 2

Tools: Salesforce CRM, Slackbot, Notebook LM

Business Problem: Account onboarding can be time consuming and challenging to capture the relevant information.

1. Pull the account record in Salesforce CRM — review key details, contract history, and open opportunities.
2. Search Slack for past conversations related to the account using Slackbot: 'Tell me everything relevant about [Account X] from internal Slack discussions.'
3. Review recent emails and meeting notes from or about the account.
4. Upload compiled materials — Slack summaries, CRM notes, email threads, and past presentations — into Notebook LM to create a unified account intelligence repository.
5. Use Slackbot to surface any open action items, flagged issues, or recent escalations related to the account.
6. Synthesize the findings into a concise account briefing to share with your team or use to prepare for the first customer meeting.

Transcript-First Call Summary Workflow

Tools: Google Gemini, AI Transcription Tool

Business Problem: Using automatic AI generated summaries can cause inaccuracies. Instead of summarizing a summary, always go back to the original transcript for a higher-quality, more accurate output.

1. After a customer call, allow the AI transcription system to capture the full transcript.
2. Do not rely on the auto-generated summary, but retrieve the original raw transcript instead.
3. Paste the full transcript into Gemini (or another high-capacity reasoning model) and request a structured summary.
4. Review the AI-generated summary for accuracy before sharing internally or using for follow-up actions.
5. Use this summary as the basis for CRM updates, follow-up emails, or next-step planning.

Notebook LM as a Learning Asset Generator

Tools: Notebook LM, Google Gemini

Business Problem: Studying and passing certifications can be time-consuming and challenging to complete. Use Notebook LM as a study partner to generate quizzes, flashcards, slide decks, podcast-style audio briefings, video voiceovers, and hierarchical mind maps from the same source material. Take advantage of the range of display options to support your learning style preference.

1. Upload training materials, certification study guides, or internal documentation into a Notebook LM notebook.
2. Use Notebook LM to generate a quiz based on the content for self-assessment and exam preparation.
3. Generate flashcards for quick knowledge checks on key concepts.
4. Create an infographic or structured report to share key takeaways with teammates.
5. For auditory learners: generate a podcast-style briefing to absorb the content while on the go.

Workflows for Individual Contributors

These workflows reflect how non-managerial employees across functions are using AI to manage information overload, improve prompt quality, and build personal productivity systems.

Slackbot Canvas Generation for Knowledge Capture

Tools: Slackbot, Slack Canvas

Business Problem: In general, when employees need to gather information, organize it and save it to Slack, it can be time consuming to find the relevant information, and they may miss content that is relevant. However Slackbot can generate a full Slack Canvas from a well-structured prompt, and employees can continue to iterate on it through follow-up prompts. The result is a reusable, shareable artifact that lives inside Slack — no external tools needed. For specific context, employees can use persona-based canvases as prompt libraries for different roles, with common prompts, suggested tools, and expected output types.

1. Identify a topic, project, or workflow area you want to document or organize.
2. Open Slackbot and prompt it with a clear, specific request where you describe the content structure you want and the purpose of the canvas.
3. When Slackbot offers to generate a canvas, accept and review the initial output.
4. Refine iteratively by continuing to prompt Slackbot within the same conversation to expand sections, adjust tone, or add detail.
5. Save the canvas to the relevant Slack channel and share with your team or keep as a personal reference library.

Persona-Based Prompt Library in Slack Canvas

Tools: Slackbot, Slack Canvas

Business Problem: Many employees share common tasks and challenges and will approach problem-solving with AI in a variety of ways. As a result, some teams maintain persona-based prompt canvases for different roles to streamline common processes. Each canvas includes common prompts, the tools to use, and guidance on what responses to expect. These are shared in Slack channels as job aids.

1. Identify the most common tasks for your role or team (e.g., drafting updates, researching accounts, summarizing meetings).
2. For each task, develop and test a prompt that reliably produces a high-quality output. Take note of what context, constraints, and format specifications work best.
3. Document each proven prompt in a Slack Canvas, organized by use case or task type.
4. Include notes on which tool to use, what inputs are needed, and what a good output looks like.
5. Pin the canvas to your team channel and share with colleagues. Invite them to contribute their own prompts to build a shared library.

Slack Channel Navigation Workflow (Automation)

Tools: Slack Workflow Builder

Business Problem: Content in Slack can be difficult and time-consuming to locate. Creating a Slack Workflow using the workflow feature is an efficient way to save time searching for information. Even a small automation like this one can save meaningful time at scale.

1. Identify a repetitive navigation or routing task. For example, frequently needing to locate specific channels across a large Slack workspace.
2. Open Slack Workflow Builder and create a new workflow triggered by a button click or slash command.
3. Configure the workflow to present a dropdown or selection menu of the most-used channels.
4. When triggered, the workflow routes the user directly to their selected channel with one click.
5. Share the workflow in your team channel so others can benefit from the same shortcut.

Meeting Transcript Summarization for Action Tracking

Tools: SlackBot, Gemini

Business Problem: During red account escalations, multiple stakeholders meet daily to manage a crisis. Each of these meetings generates new context that is hard to keep track of. Using AI to summarize meeting notes helps ensure that commitments are captured, owners are identified, and nothing falls through the cracks between sessions.

1. After a meeting, allow the AI transcription tool to capture the full transcript.
2. Upload or paste the transcript into Slackbot or Gemini and prompt for a structured summary.
3. Request that the summary includes key decisions, action items with owners, open questions, and timeline commitments.
4. Review the output for accuracy by cross-referencing against your own notes for any high-stakes commitments.
5. Distribute the summary to meeting participants and log action items in the relevant project tracker or CRM record.

Gemini Gems for Repeatable Auditing or Coaching

Tools: Google Gemini (Gems)

Business Problem: Auditing a document is error-prone and time-consuming to complete. Using an already-created Gemini Gem compares an uploaded compliance document against a reference framework and outputs findings in a structured spreadsheet.

Business Problem: CSM's are tasked with continuous improvement, which can be challenging to self assess. Using an already created Gemini Gem allows CSMs to upload a meeting transcript and receive feedback on how the meeting went and areas of improvement.

1. Identify a task you perform repeatedly such as auditing a document against a standard, or reviewing a meeting transcript for coaching insights.

2. Open Gemini and create a new Gem. Write clear instructions describing what the Gem should do, what inputs to expect, and what format the output should take.
3. Test the Gem with a sample input. Refine the instructions based on the quality of the output.
4. Share the Gem link in your team's prompt library so colleagues can use the same workflow without setup.

V2MOM Goal-Setting with the AI Agent
Tools: Salesforce V2MOM Agent, SlackBot, Basecamp
Business Problem: Salesforce employees are tasked with writing their annual performance review based upon their manager's V2MOM and their professional goals. The process requires employees to have several meetings, review documents, and spend time writing. Sometimes the quality of V2MOM's has suffered due to misalignment of goals because employees aren't always clear on their priorities. Salesforce reimaged this process with an AI agent that recommends methods and measures based on the employee's vision and values. The result is higher-quality V2MOM's that are faster to complete.
1. Employee reads their manager's published V2MOM in Basecamp. They identify the 2-3 methods and measures most relevant to their role.
2. Employee opens the V2MOM agent and pastes in their job role, their manager's V2MOM excerpt, and a few sentences about their top priorities for the year. The agent uses this context to recommend a full V2MOM draft.
3. Employee reads the AI-generated draft critically to consider: Does the vision reflect their ambitions? Are the measures appropriate? They prompt the agent iteratively to refine.
4. Employee shares the refined draft with their manager in a 1:1, discussing whether the methods and measures reflect team priorities. Human judgment is essential here — this step cannot be delegated to AI.
5. Employee publishes the final V2MOM and uses Slack Bot or a calendar tool to set quarterly check-in reminders to refresh the document mid-year.

Workflows for Engineers

These workflows reflect how technical and enablement professionals use AI tools to manage complexity, support developers, and build scalable systems.

AI Tooling Landscape Mapping for a Team or Role

Tools: Slackbot, Slack Canvas, Enterprise AI Tools Hub

Business Problem: The tools that technical teams have access to using changes on a regular basis. Tool access also varies significantly based on by role, department, and data permissions. Before building workflows, engineers need to understand what tools they have access to. Some teams maintain the enterprise-approved tools list as a Slack Canvas, updated regularly.

1. Access the enterprise AI tools hub (available as a Slack Canvas in your organization) to review the current list of approved tools for your role and department.
2. Identify which tools are universally available (e.g., Gemini, Notebook LM, Slackbot) versus role-specific (e.g., Cursor, coding tools for engineers).
3. For each tool relevant to your role, locate the available enablement content in the hub, such as quick-start guides, example prompts, and use case documentation.
4. Build or update a Slack Canvas that maps the tools your team uses, the use cases each tool is best suited for, and any access or permission constraints.
5. Share the canvas in your team channel and keep it updated as the tool landscape evolves.

Training Request Intake via Slack Workflow

Tools: Slack Workflow Builder, Slack Canvas

Business Problem: The process for requesting training was time-consuming and prone to error as it relied upon emails and Slack exchanges. To help streamline this process, this workflow was developed to manage training requests from across Salesforce's large tech and product organization. The workflow creates a consistent, trackable intake process, but note that this simple workflow can be applied to budget requests, access approvals, or other structured intake processes.

1. Open Slack Workflow Builder and create a new workflow in your team's training request channel.
2. Configure the workflow to be triggered by a button press and label it clearly (e.g., 'Request Training').
3. Add a form that collects the key information you need: type of training, audience size, timing, and business context.
4. Set the workflow to automatically route completed forms to the team's intake channel and notify the relevant person.
5. Respond to requests asynchronously and use Slackbot to summarize or categorize incoming requests if volume is high.

Workflows for Leaders

These workflows reflect how people managers use AI to unlock capacity, automate administrative tasks, and lead their teams more effectively.

Red Account Escalation: AI-Assisted Status Updates
Tools: Slackbot, Salesforce CRM
Business Problem: Certain managers need to handle escalations for Salesforce Signature accounts. Red account situations involve high emotions, executive visibility, and tight turnaround time responses. AI-assisted status generation compresses what was previously a multi-source, manually written process into a prompt-and-review workflow. Note that all customer-facing communication must be reviewed and sent by a human.
1. When a red account is opened, a dedicated Slack channel is created for the escalation team. Use this as your primary coordination hub.
2. Prompt Slackbot to search the channel and the CRM record: 'Generate a 3-sentence executive-level update on [Account X] escalation risk using current Slack discussions and the CRM resolution plan.'
3. Review the AI output for accuracy. Adjust tone and detail level based on your audience.
4. Use Slackbot to generate tailored updates for each stakeholder group: a brief for internal leadership, a status note for the renewals team, and a customer-facing progress summary.
5. Set a reminder in Slackbot to send the next update by a specific time to keep stakeholders informed without requiring manual calendar management.

Manager Agent: Policy & HR Knowledge Retrieval
Tools: Agentforce Manager Agent (via Slack)
Business Problem: Managers need to manually search internal portals for HR policy guidance which is time-consuming and error-prone, as it can be challenging to locate the essential and most current information. In response to this problem, a Manager Agent is built in Agentforce and is accessed through Slack. Note that managers cannot modify the agent, but they can use structured prompting to get more tailored responses.
1. Open Slack and navigate to Tools > Agents > Manager Agent.
2. Type your question directly: for example, 'How can I manage inconsistent performance?' or 'What is our PTO policy for team members in [region]?'
3. The Manager Agent retrieves relevant guidance from internal knowledge articles and policy documentation, presenting step-by-step recommended actions.
4. Review the response and apply your own judgment to the specific employee situation as agent guidance should be considered a starting point, not a final answer.
5. If the agent cannot find the information you need, escalate to your HR business partner or search Basecamp directly.

Manager Agent: Promotion Nomination Workflow

Tools: Agentforce Manager Agent (via Slack)

Business Problem: Salesforce operates biannual promotion cycles (H1/H2). The promotion nomination process was previously completed through a separate form which was time consuming and it could be challenging to understand the process. The Manager Agent now guides managers through the entire nomination as a conversational interaction in Slack. Future iterations will integrate E360 employee performance dashboards for contextualized readiness assessments.

1. During the promotion nomination window, open the Manager Agent in Slack.
2. Type: 'I would like to promote [employee name].' The agent will identify matching direct reports and confirm eligibility requirements.
3. Respond to the agent's guided prompts: provide the intended new title, business justification for the promotion, skills evidence, and any changes to reporting structure.
4. Review the complete nomination summary that the agent generates, confirm accuracy, and submit.
5. Receive a confirmation receipt — the nomination is now in the system without requiring a separate form.

Weekly Team Status Update Automation

Tools: Slack Workflow Builder, Slack Canvas

Business Problem: The process of having meetings where team members shared their status was time-consuming and often not productive. A new workflow was built to eliminate the need for employees to provide status reports during meetings. Instead, team members complete their updates asynchronously and the workflow collects and structures the responses automatically. The result is leadership reports are populated without a meeting, and the meetings that do happen are higher-value.

1. Open Slack Workflow Builder and create a recurring weekly workflow in your team channel. Set it to trigger on a consistent day and time.
2. Configure the workflow to prompt each team member with a short status update request: current progress, blockers, and priorities for the coming week.
3. Set the workflow to collect responses and automatically populate a shared tracking spreadsheet or Slack Canvas.
4. Review the consolidated summary before your leadership sync. Since the AI has already aggregated the information; your job is to review and add context.
5. Redirect reclaimed meeting time toward strategic discussion, coaching, or problem-solving rather than status reporting.

Tech Tip Tuesday: Peer AI Learning Automation

Tools: Slack Workflow Builder

Business Problem: Many employees are using a variety of technical and AI tools in a way that adds value to their daily work, but there isn't a method to capture and share these use cases with team members. To improve the process of knowledge sharing, a standing weekly automation was set up that surfaces how different team members are using AI tools in practice, normalizes experimentation, and creates a prompt-sharing culture without requiring formal training session. This workflow is an accessible starting point for any team.

1. Open Slack Workflow Builder and create a recurring weekly workflow in your team channel.
2. Configure the workflow to post a prompt every Tuesday: 'Share one way you used technology this week that others might find useful.'
3. Allow team members to reply directly in the thread, no facilitation is needed.
4. Review the thread periodically to identify high-value practices worth capturing in your team's prompt library or canvas.
5. Encourage team members to try each other's techniques. This is peer learning built into the flow of work.

New Manager Onboarding Journey (Automated Slack Messages)

Tools: Slack Amplified Messages, Slack / Workday Integration

Business Problem: New managers don't always have a structured onboarding process that is scalable and includes current Salesforce policies. One team uses Slack's amplified messaging capability, integrated with Workday, to deliver a structured onboarding journey to new managers. Because Slack is integrated with Workday, messages can be targeted by grade level, geography, department, or any Workday attribute. Note: building this workflow requires collaboration between the L&D team, comms, and the Slack technical team.

1. When a new manager is hired, promoted, or joins through an acquisition, the event is recorded in Workday.
2. The Slack/Workday integration identifies the manager and automatically starts their onboarding journey timer.
3. Day 30: An automated Slack message is sent to the manager with relevant action items, resource links, and a check-in prompt.
4. Day 90: A follow-up message is sent with next-stage guidance and reminders for outstanding requirements.
5. Additional automated touchpoints are configured throughout the 90-day window as the manager progresses through their onboarding.

Manager Professional Development Nudges (Proposed Workflow)

Tools: Slackbot, Gemini, Slack Workflow Builder

Business Problem: First-line sales managers can be challenged with the dual responsibility of carrying individual contributor targets alongside people management responsibilities. This means personal development is consistently deprioritized. A workflow that embeds learning nudges into the flow of work and blocks calendar time, helps to address this structural problem.

1. Manager sets a personal development goal in Slackbot or Gemini: for example, 'I want to become a better coach' or 'I want to improve well-being conversations with my team.'
2. Configure a Slackbot or Gemini workflow to send periodic nudges tied to that goal such as short reflection questions, micro-learning prompts, or suggested actions.
3. Ask Slackbot to review your calendar and identify available time slots for development activities.
4. Block identified time in your calendar for development to help make it a visible commitment.
5. Complete periodic self-checks via the workflow through brief reflections on progress that don't require attending a formal session.
